DETAILED ACTION

Response to Amendment

The Examiner acknowledges the addition of claims 27-30 as well as the amending of claim 25.

Response to Arguments

The Examiner acknowledges the arguments presented in the Remarks filed 05/18/2007. The current office action is being made non-final in order to address concerns raised by the Applicant as to the usefulness of Si materials being used with InP based materials, as well as to further clarify the previous rejections.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

The factual inquiries set forth in *Graham* v. *John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:

- 1. Determining the scope and contents of the prior art.
- 2. Ascertaining the differences between the prior art and the claims at issue.
- 3. Resolving the level of ordinary skill in the pertinent art.
- 4. Considering objective evidence present in the application indicating obviousness or nonobviousness.

Art Unit: 2828

Claims 1, 5-10, and 13-16 are rejected under 35 U.S.C. 103(a) as being unpatentable over Orenstein et al. (US 6940878) in view of Yamada et al. (US 6027254).

With respect to claim 1, Orenstein teaches (fig.3a,5d), a reconfigurable laser transmitter comprising: an integration platform having a substrate (fig.3a), a gain element (col.3 lines 36-37) having an optical output, the gain element having a body of material different from said integrating platform (active layer would inherently be a different body of material in order to lase), being disposed on said integration platform, a first optical path (fig.3a laser WG, fig.5d passive WG 1.14) receiving optical output from said gain element, said first optical path comprising a waveguide (laser WG, passive WG) within said integration platform, a tunable microresonator (fig.3a A, fig.5d ring) optically coupled with said first optical path, a second optical path coupled with said tunable microresonator, said second optical path comprising a waveguide (fig.3a upper, fig.5d 1.3 layer), and a fixed grating (fig.3a B, alternate additional ring used in fig.5d) in said integration platform (col.5 lines 4-5, on waveguide so in platform) and coupled with said second optical path. Orenstein does not teach the waveguides and substrate to be of silicon material. Yamada teaches a gain medium integrated onto a silicon substrate and using silicon waveguides (fig.9). It would have been obvious to one of ordinary skill in the art at the time of the invention to combine the substrate and waveguide material of Yamada with the transmitter of Orenstein in order to allow for heat dissipation through the substrate (Yamada, col.1 lines 40-52), as well as to use silicon waveguides for the guiding (non-doped guides) as this well known waveguiding material (optical fibers) is a

Application/Control Number: 10/766,103

Art Unit: 2828

low loss transmitter of a plurality of wavelengths which would function well in Orenstein's tunable system.

References noted, but not relied upon, that teach the use of InP based materials in conjunction with silicon substrates, waveguides, and active (doped) mediums are: US 2005/0147355, 2004/0208413, 2004/0114869, 2004/0081393, and 2003/0034538.

With respect to claim 5, silicon inherently has a temperature sensitivity of less than 0.1A/C (approx. 0.01 A/C, see Conradi US 6061369).

With respect to claims 6-7, Orenstein teaches electrical (Vernier) tuning (col.3 lines 60-63).

With respect to claim 8, Orenstein teaches the use of a sampled grating (col.3 lines 45-48).

With respect to claim 9, Orenstein teaches the gain element is a laser and the grating is used for locking the laser thereto (col.1 lines 31-37).

With respect to claim 10, Orenstein and Yamada teach the transmitter as outlined in the rejection of claims 1 and 9 above, and Orenstein additionally teaches the microresonator is mounted on the integration platform.

With respect to the UV-induced limitation found in claim 10, these limitations merely detail the methods of forming the device. The method of forming a device is not germane to the patentability of the device itself, therefore these limitations are not given patentable weight. At best these claims could be characterized as product-by-process claims, where the process limitations are not limiting, only the structure implied by the

Application/Control Number: 10/766,103

Art Unit: 2828

process. See MPEP 2113. Here, the structure implied by the process steps is merely the structure of claim 10.

Claims 13-16 are rejected for the same reasons outlined in the rejections to claims 6, 5, 8, and 7 respectively.

Claims 3 and 11 are rejected under 35 U.S.C. 103(a) as being unpatentable over Orenstein, Yamada, and further in view of Soref (US 6195187).

With respect to claims 3 and 11, Orenstein and Yamada teach the transmitter outlined in the rejections to claims 1 and 10 below, but do not teach the use of a microdisk. Soref teaches a coupling device (between two waveguides) which uses a microdisk. It would have been obvious to one of ordinary skill in the art at the time of the invention to replace the microring of Orenstein and Yamada with the microdisk of Soref in order to obtain a more favorable contact geometry (Soref, col.5 lines 60-64).

Claims 17, 19-23 and 26 are rejected under 35 U.S.C. 103(a) as being unpatentable over Orenstein, Yamada, Soref, and further in view of Tanaka et al. (US 6320888).

With respect to claim 17, Orenstein, Yamada, and Soref teach the transmitter outlined in the rejections to claims 1, 3, and 6 above, but do not teach the grating to be formed in the waveguide. Tanaka teaches a gain medium and silicon waveguide integrated on a silicon substrate (fig.1) wherein the grating is written directly unto the waveguide. It would have been obvious to one of ordinary skill in the art at the time of

Application/Control Number: 10/766,103

Art Unit: 2828

the invention to combine the transmitter and separated waveguide/grating of Orenstein, Yamada, and Soref with the combined waveguide/grating of Tanaka in order to reduce the amount of loss due to evanescent coupling when using an external grating.

Claim 19 is rejected for the same reasons as claim 7 above.

Claim 20 is rejected for the same reasons as claim 9 above.

With respect to the UV-induced limitation found in claim 21, these limitations merely detail the methods of forming the device. The method of forming a device is not germane to the patentability of the device itself, therefore these limitations are not given patentable weight. At best these claims could be characterized as product-by-process claims, where the process limitations are not limiting, only the structure implied by the process. See MPEP 2113. Here, the structure implied by the process steps is merely the structure of claim 17.

With respect to claim 22, Orenstein further teaches the step of coupling a fixed optical resonator filter (B) to said tunable microresonator (A) (see figs.4a/b).

With respect to claim 23, Orenstein further teaches emitting light at 1.55um (col.3 lines 29-42, an international standard for silicon waveguides (fibers)).

With respect to claim 26, Orenstein further teaches forming another.waveguide in the integration platform (either WG or upper). Orenstein does not teach the microresonator to be of III-V materials. These materials are known in the art to be used with semiconductor lasers and resonators. It would have been obvious to one having ordinary skill in the art at the time the invention was made to make the resonator of these known materials, since it has been held to be within the general skill of a worker

in the art to select a known material on the basis of its suitability for the intended use as a matter of obvious design choice. *In re Leshin*, 227 F.2d 197, 125 USPQ 416 (CCPA 1960).

Claim 29 is rejected for the same reasons outlined in the rejection to claims 1 and 17 above.

Allowable Subject Matter

Claims 27-28 and 30 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

Conclusion

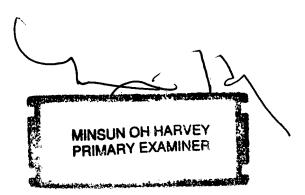

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Tod T. Van Roy whose telephone number is (571)272-8447. The examiner can normally be reached on M-F.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Minsun Harvey can be reached on (571)272-1835. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
